TASK 6: Host a Static Website with GitHub Pages

Objective: Deploy a simple HTML website using GitHub Pages.

Tools: GitHub Pages

Deliverables: Live website link and GitHub repository URL

Mini Guide / Steps to Deploy:

1. Create an index.html file. Build a simple static HTML file locally as the landing page of your website.

2. Push it to a new GitHub repository. Create a new public repository on GitHub and commit/push your code to the default branch.

3. Configure Repository Settings. Go to your repository → **Settings** → **Pages** on the left sidebar.

4. Enable GitHub Pages. Under **Build and deployment**, select the source branch (e.g., main) and the root folder (/ (root)), then click **Save**.

5. Access Live Website. Wait a few moments for the build to complete. Access your live website from the URL provided by GitHub.

6. Customization. Try adding a style.css file to customize your website layout, colors, and styling.

Outcome: By completing this task, you will learn how to build, push, and deploy static web content online for free using professional development workflows.
